Class Code and Premium Audit Assistant

Scenario

Linden Shore Mutual writes workers' compensation insurance in Maryland. Underwriting is quoting six new employers, and before a quote goes out the premium audit team checks that each employer's payroll sits under the right class code. Employers fill in their own payroll split on the application, and the audit team confirms or corrects it from the employer's records. Nadia Brennan, Senior Premium Auditor, wants a reusable Agent Skill that does the first pass on any employer file: suggest the class codes, allocate the payroll to them, and list the questions she should put to the employer. The company, people, employers and records are fictional.

Your task

Interview Nadia Brennan to learn how her team classifies people and counts payroll, and where the employer files and the company's classification rules are kept. Then build the Skill and run it on all six employers: Harbor Point Legal, Bay Crest Exteriors, Severn Homebuilders, Patuxent Electric, Annapolis Courier and Larkspur Lane Bistro.

The employer files and the classification rules are not in the starter repository. Read them from the locations the auditor gives you, during each run. This company uses its own class codes; public classification manuals do not apply and will give wrong answers. Where the written rules leave a case open, or an employer's records disagree with what the employer reported, find out from the auditor how her team handles it rather than guessing, and say in the report which records decided each case. The Skill classifies and allocates payroll only; it does not set rates or quote premium.

Deliverables

Interview records: `interviews/*.md`. Include the original Markdown export of every interview session, with its session metadata and complete participant-visible messages. Keep one final complete export per session without rewriting or summarizing it, and commit it with your code. If the export is unavailable, contact the facilitator; do not manufacture a replacement.

Paths are relative to your repository.

Path	Required content
`skills/class-code-assistant/SKILL.md`	Reusable Skill instructions with name and description metadata, inputs, invocation,

Path	Required content
	outputs, error behavior and references to its supporting files
Supporting Skill files	Your code and focused references under the Skill or documented project paths; no answers hard-coded for these six employers
`README.md`	Setup, the command that runs the Skill on one employer and on all six, and how you verified the results
`deliverables/codes/<employer>.csv`	One file per employer, named `harbor-point-legal.csv`, `bay-crest-exteriors.csv`, `severn-homebuilders.csv`, `patuxent-electric.csv`, `annapolis-courier.csv` and `larkspur-lane-bistro.csv`. Columns exactly `class_code,payroll_allocated,rationale_ref`: one row per class code that carries payroll at that employer for the audit period, no rows with zero payroll. `payroll_allocated` is US dollars to the cent without thousands separators. `rationale_ref` is the identifier, exactly as printed in the company's classification rules, of the paragraph that describes the code
`deliverables/audit-questions.md`	One section per employer with the questions the auditor should put to the employer before signing off. Each question names the employee, subcontractor or record it is about. Every adjustment you make, and every record your decision relies on, has at least one question asking the employer to confirm it
`deliverables/audit-report.md`	One section per employer: the codes and payroll you allocated; where and why your allocation differs from the employer's own

Path	Required content
	split; every adjustment, naming the employee or payment it concerns and its amount to the cent; and the records that support it
Coding-session evidence	The capture tool's real session records for the submitted code revision; self-written logs do not substitute for them

In your coding session, decide and state in your own words whether you accept each employer's own payroll split, and what record that decision rests on.

Interview

Interview Nadia Brennan, Senior Premium Auditor, through the interview channel the facilitator provides. Investigate the business work and obtain the rules, source locations and explanations you need; no special question wording is required.

This is a real-case Challenge, closer to client work. The course rule is to plan for at most 3 conversations with the stakeholder, so prepare before each conversation and ask completely.

Interview rule. You conduct the stakeholder interview yourself, and the questions are yours. Do not connect a coding agent or any other AI to the interview to run, script, or automate it. The interview transcript is assessed together with the code; a project whose interview was run by an agent is not scored.

Submit

Commit the Skill, the deliverables and `interviews/` to your repository and keep your coding session captured. Keep secrets out of the repository. Your README must explain how to rerun the Skill on a new employer file.
